

1. Open google maps. Go to the menu button on the left of the search box.

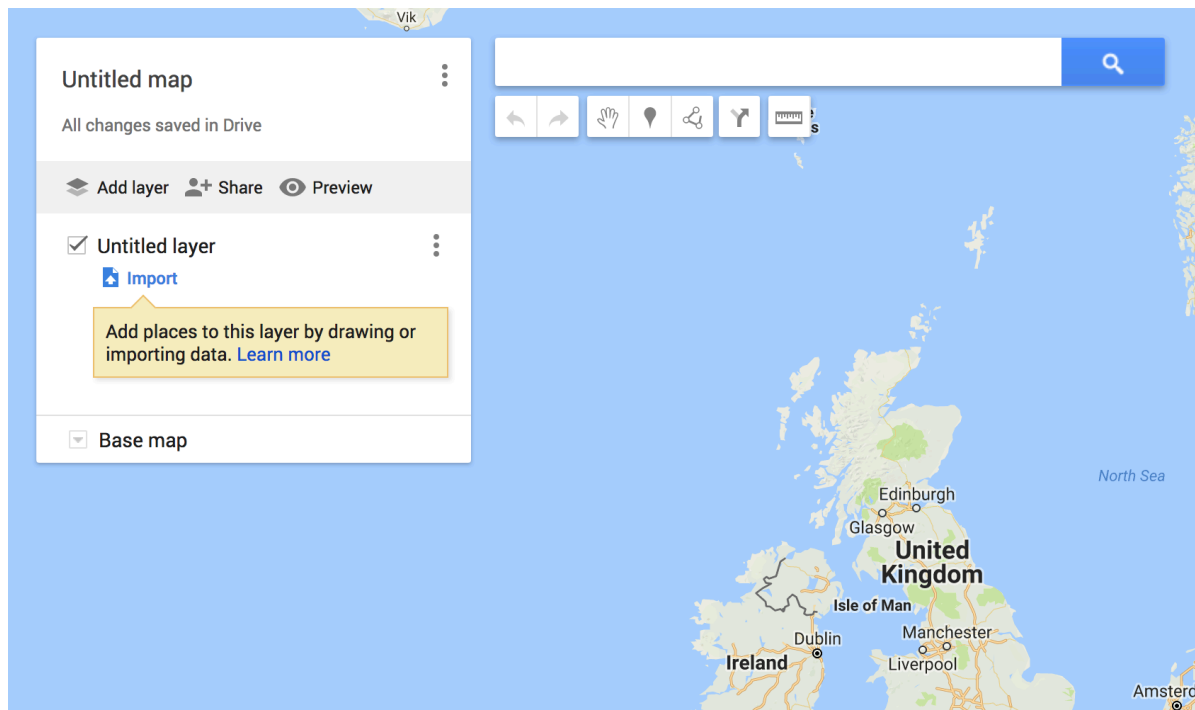

2. This opens a menu, select 'Your Places'. Around now it will ask you to log in to a google account if you haven't already.

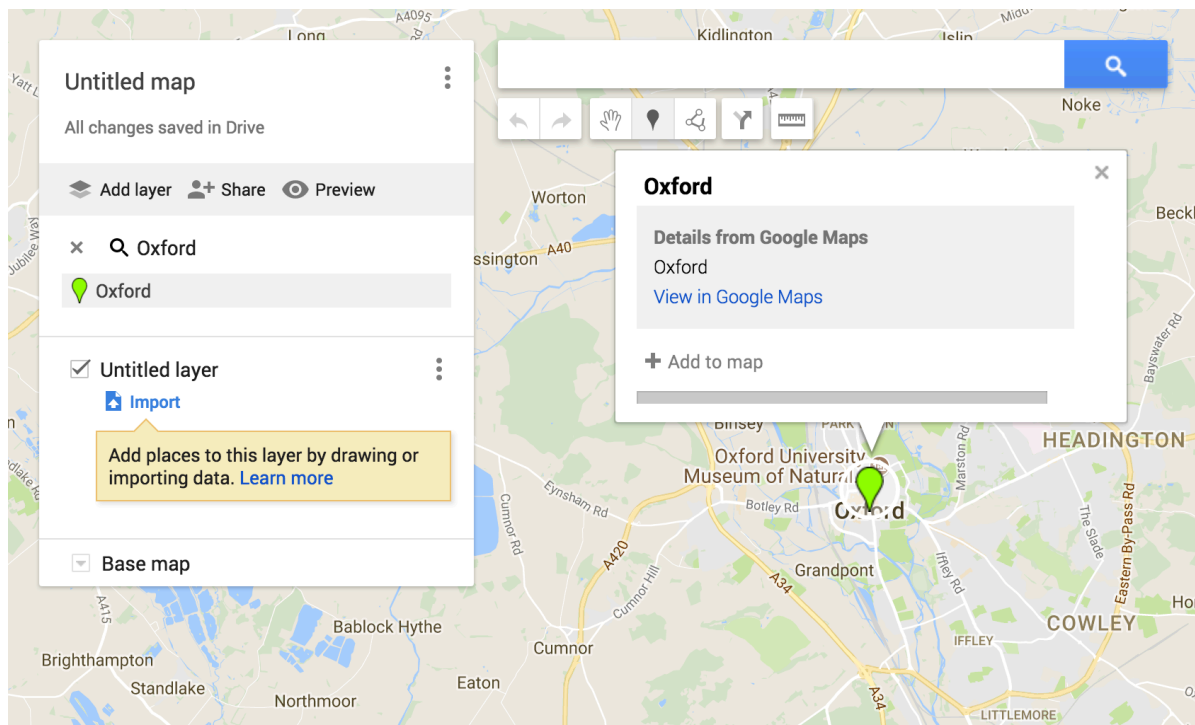

3. This takes you to the 'Your places' menu. Select the 'MAPS' tab. At the bottom of this sidebar select 'CREATE MAP'.

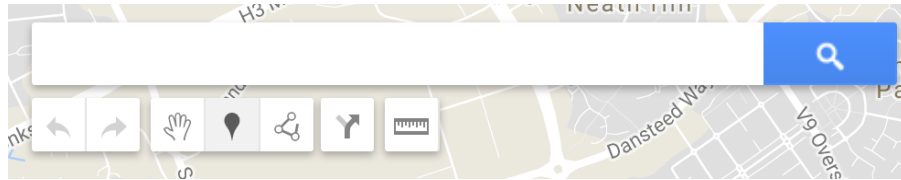

4. This brings up an empty map canvas in a new window

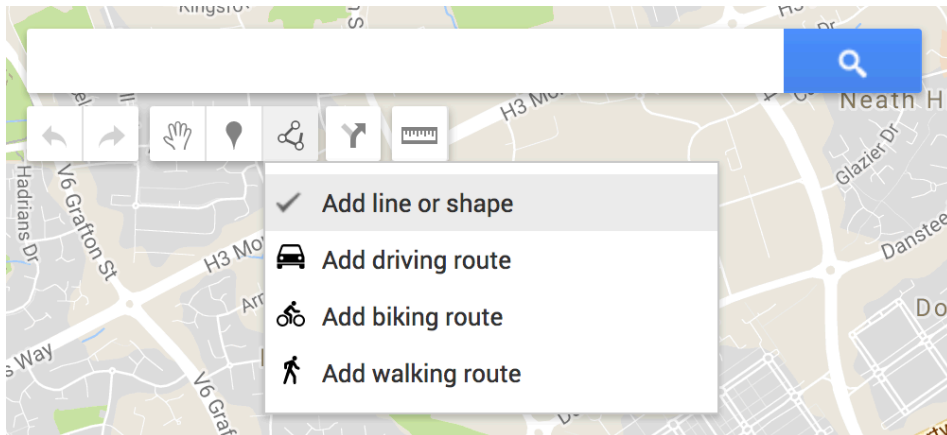

5. Searching for a place in the search box will take you there and give you the option to 'add to map'.

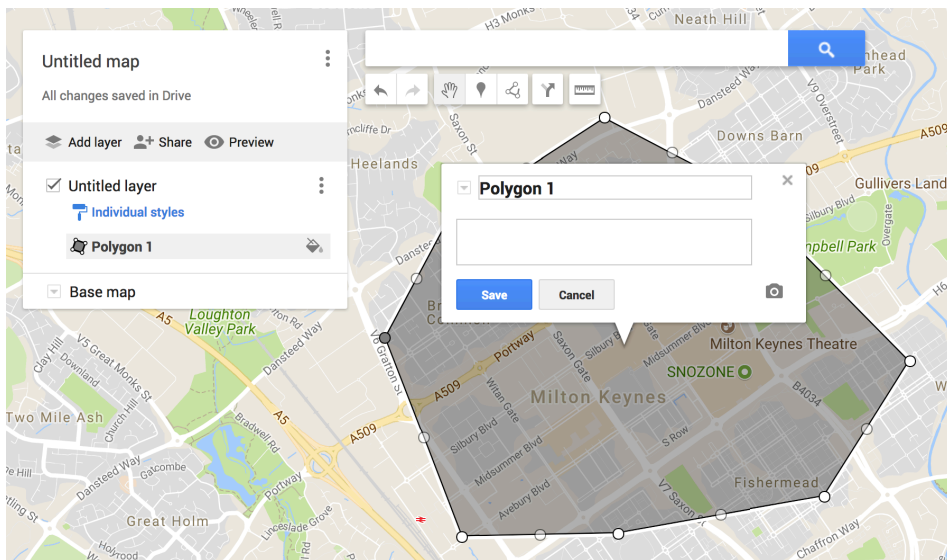

6. You can also zoom to any point on the map and select to add it to the map by clicking the 'Add Marker' button

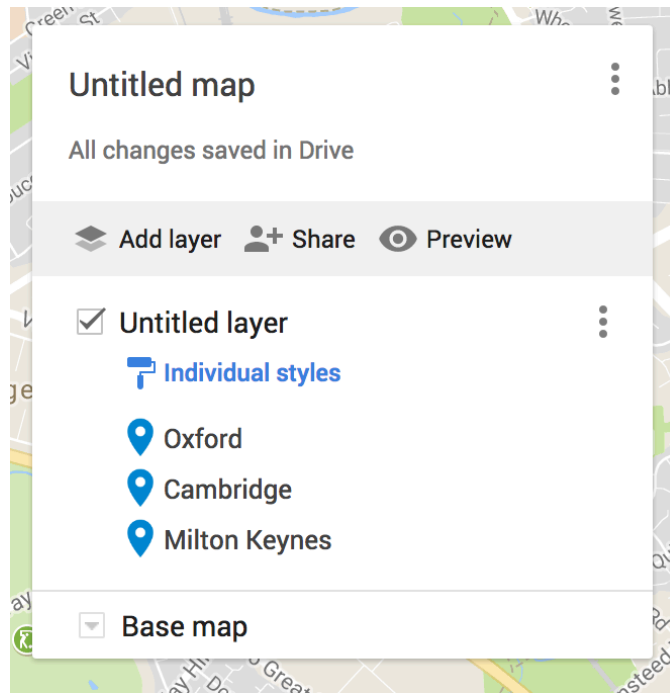

7. If you want to draw a boundary (e.g. the outline of a new settlement) click the button with 3 connected dots below the search bar. This will give you to 'Add line or shape'.

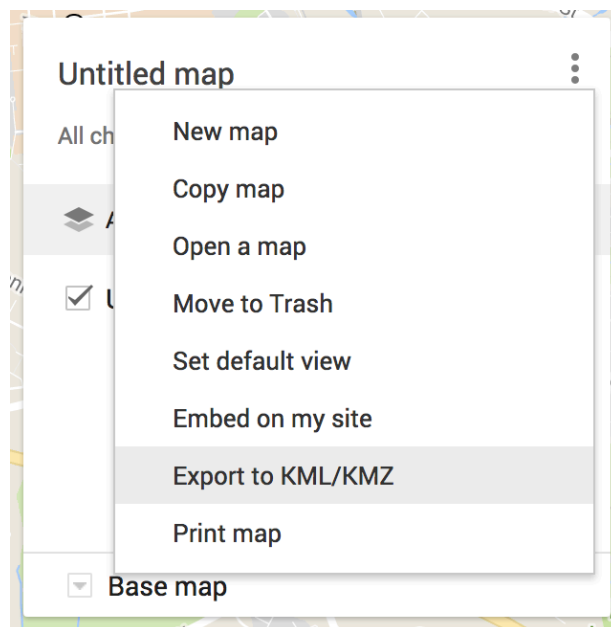

8. You draw a boundary by clicking to create points which it automatically draws lines between. These will be saved as one shape.

9. All your points and polygons will accumulate in a 'layer' on the left hand side. From this sidebar you can go quickly to the points you've already added/delete points/etc.

10. When you're done – click on the three dots in the top right corner of that box (next to 'Untitled map', not next to 'Untitled layer'). Select 'Export to KML/KMZ' from this menu.

11. This opens a pop-up. You can select either to export the whole map, or just a specific layer. For example – you may have made multiple layers with different possible road routes in them. The tool needs each possible road to be a separate file, so select one layer at a time. Also select the 'export to a .KML file' option. Once you click download this will be downloaded into your downloads folder.
